case 10/652334

Hi,

I would like to request the following search (commercial and interference): SEQ ID NO:1-9 in the protein databases.

Thank you,

Delia M. Ramirez, Ph.D.
Patent Examiner
Recombinant Enzymes-Art Unit 1652

```

The invention relates to a method of identifying an agent that increases nonsense suppression, by contacting modulator of translation termination (MTT1) also referred to as helicase B (HCSB) in Saccharomyces cerevisiae. The method is useful for identifying compositions or agents which increase nonsense suppression. The invention may also be used for antiviral therapy and for suppression of pathological nonsense mutations. The present sequence is Saccharomyces cerevisiae motif peptide

         the RNA helicase MTT1 with a composition or agent under conditions permitting binding between the MTT1 and the composition, detecting specific binding of the test composition or agent to the MTT1. The composition and methods are useful for modulating the fidelity of translation termination or for identifying agents that: affect the functional activity of mRNAs by altering frameshift frequency, permit monitoring of a termination event, promote degradation of aberrant
                                                                                                                                                                                                   Identifying a test composition or agent that modulates the efficiency of translation termination comprises contacting the MTTI with the test composition or agent, and determining if the test composition or agent

The agents, which may be antagonists or agonists, are useful in screening, diagnostic and therapeutic purposes, for diseases or conditions resulting from or cause premature translation, such as beta-thalassaemia, beta-globin, Duchenne/Becker Muscular Dystrophy, Haemophilia B, Haemophilia B, Von Willebrand Disease, osteogenesis Imperfecta, Breast cancer, Ovarian Cancer, Wilms Tumour, Hirschaprung disease, Cystic fibrosis, Kidney Stones, Familial hypercholesterolaemia, Retinitis Pigmentosa, or Neurositoromatosis, Retinoblastoma, ATM or Costmann Disease. The present sequence represents the amino acid sequence of the yeast translation termination modulation
carry out translation termination in eukaryotic cells, peptidyl eukaryotic release factor (eRF) 1 and eRF3. The complex can be used to modulate peptidyl transferase activity during translation in a cell. It can be administered therapeutically combined with a carrier in pharmaceutical compositions to treat diseases associated with peptidyl
                                                                                                                                                                                                                                     New multiprotein complex which can modulate peptidyl transferase activity during translation, useful to treat diseases associated with peptidyl transferase activity e.g. Duchene/Becker Muscular Dystrophy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Helicase B; HCSB; MTT1; modulator of translation termination; eRF1; eRF3; eukaryotic release factor; peptidyl transferase; beta-thalassemia; beta-globin; Duchene/Becker Muscular Dystrophy; antianemic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 9
                                                                                                The invention provides a new multiprotein complex which can modulate peptidyl transferase activity during translation. The complex comprises the gene encoding Helicase B (HCSB; renamed MTIL, for Modulator of Translation Termination) and the conserved proteins known to interact and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC framebilt mutation e.g. beta-thalassemia, beta-globin, Duchene/Becker CC Muscular Dystrophy etc. It can be used to identify disease conditions CC involving a defect in the complex, by transfecting cells with encoding CC nucleic acid and determining the proportion of defective complex before and after transfection. It is also useful to screen for drugs involved in CC peptidyl transferase activity during translation, inhibiting the CC interaction between MTT1 and eRF3 or involved in enhancing translation CC translation. Vectors comprising polynucleotides encoding the complex (or CC interfere with complex expression and so modulate the efficiency of CC translation termination of mRNA and/or degradation of aberrant CC transcripts in a cell. Agents binding to the complex can be identified CC and included in therapeutic compositions useful as above, and/or used to modulate peptidyl transferase activity during translation in cells. They can also useful to modulate the efficiency of translation termination of CC mRNA at a nonsense codon and/or promote degradation of aberrant CC transcripts in cells. The method can be useful to identify genes.

CC sequences AAY77804-812 represent motifs I-IX comprised in the genes of interact useful for modulation translation to termination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (2) an expression vector comprising (I); (3) a host cell genetically engineered to comprise (I) which is operatively associated with a regulatory sequence that modulates expression of (I) in the host cell; (4) a polypeptide (II) encoded by (I); (5) a composition comprising the polypeptide of (4) and a carrier; (6) an antibody directed against the polypeptide of (4); (7) detecting (I) or the polypeptide of (4) in a sample; (8) identifying a compound that binds to the polypeptide of (4); (9) producing the polypeptide of (4); and (I0) a collection of polymucleotides comprising at least one of the polymucleotide sequences (I). The polymucleotide (I) can be used as hybridisation probes, oligomers or primers, for chromosome or gene mapping, for the recombinant production of proteins, and for generating antisense DNA or RNA.
                             ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                              Disclosure;
                                                                                                                                                                                                                                                                 Novel isolated nucleic acid encoding a Staphylococcus epidermis polypeptide, useful for diagnosing and treating bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                              14-AUG-1997;

(I) can have antibacterial activity and therefore can be used in CC vaccination. The mucleic acids (I) may be used to produce the S. (C epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the CC used to vaccinate subjects and to raise antibodies against the bacteria. CC The polypeptides may also be used to assay for other inhibitors of their CC activity and therefore identify compounds that may be used for the CC treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA CC polymucleotide sequences from the present invention. AAH55091 to AAH55090 represent oligonucleotide sequences and primers which are used in the CC exemplification of the present invention. Na. The present invention Specifically claims all the polymucleotide sequences given in the CC sequence listing of the present invention. Na. The present invention cCC sequence listing of the present invention. Naver the sequence CC listing only goes up to SEQ ID NO:4454 so even though sequences are present contained to the contained contained to the sequence are present contained to the contained contained to the contained contained to the contained contained to the present invention. The contained contained to the present invention contained to the contained contained to the present of the present apecification, however the sequence contained contained to the present of the contained to the contained contained contained contained con

The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                          S. epidermidis open reading frame protein sequence SEQ ID NO:2638

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (I(I), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) wis the production of vectors containing them which are used to produce hosts cells which express the polypeptides (II) vis the production of vectors containing them which are used to produce hosts cells which express the polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the reatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA represent oligonucleotide sequences and primers which are used in the emplification of the present invention. N.B. The present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH33971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polymucleotide sequences from the present invention. AAH55091 to AAH55098

                                                                                                                                                                                                                                                                                                                         represent oligonucleotide sequences and primers which are used in the exemplification of the present invention. N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 18; Page 657; 2188pp; English.

The nucleic acid of the invention may be useful in detecting the presence of Xanthomonas bacteria in a sample, as well as in plant pathology, for example, for identifying nucleic acid molecules and proteins involved in pathology caused by bacterial pests. The current sequence is that of the Xanthomonas axonopodis pv. citri (Xac) plant pathology-related XAC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Da Silva ACR, F
De Oliveira JCF,
         AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis and (II) can have antibacterial activity and therefore can be used in
                                                                                     Nucleic acids encoding useful for vaccinating

Nucleic acids encoding polypeptides from Staphylococcus epidermidis useful for vaccinating against infections, e.g. endocarditis. WPI; 2001-316495/33. N-PSDB; AAH52588.

Claim 18; Page 189; 2188pp; English

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the Ξ

The

ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55990 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention. N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     US6380370-B1
                                                                                                                                                                                                                                                                                               Disclosure; SEQ ID NO 3067; 267pp; English.
                                                                                                                                                                                                                                                                                                                                                    Novel isolated nucleic acid encoding a Staphylococcus epidermis polypeptide, useful for diagnosing and treating bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2002-381255/41
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Doucette-Stamm LA,

                                                                                                                                                                                                                                                                                                                                                                                                            AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present inverse which are used to AAH55098
                                                                                                                                                                                                                     represent oligonucleotide sequences and primers which are used in the exemplification of the present invention. N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2001-316495/33.

                                                                                                 CC given in the specification. Also described are: a recombinant expression CC given in the specification. Also described are: a recombinant expression CC vector; a cell comprising a recombinant expression vector of (1); CC producing an S. epidermidis polypeptide; an isolated nucleic acid CC comprising a nucleotide sequence of at least 8 nucleotides in length; a CC vaccine composition for prevention or treatment of an S. epidermidis CC infection, comprising a nucleic acid cited above and a carrier; treating CC preparation of an S. epidermidis infection; a recombinant or substantially CC pure preparation of an S. epidermidis polypeptide or its fragment; a CC vaccine composition for prevention or treatment of an S. epidermidis CC infection; detecting the presence of a Staphylococcus nucleic acid in a Sample; a computer readable medium having recorded in it the nucleotide CC system for identifying fragments of the Staphylococcus plasmids of commercial importance; a computer based system for identifying fragments of the Staphylococcus plasmids of commercial important nucleic acid fragments of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment CC of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment CC of the Staphylococcus genome and/or plasmids. The methods and CC infection. This is the amino acid sequence of a S. epidermidis bacterial infection. This is the amino acid sequence of a S. epidermidis protein of the staphylococcus provention and content of an Staphylococcus provention are useful for the diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    08-NOV-1997;
